

$\mathbf{r} = R_Z(\Omega) R_X(i) R_Z(\omega_p) [r \cos \nu, r \sin \nu, 0]^T$
 one factor per panel, left to right; dotted: the orbit before the turn

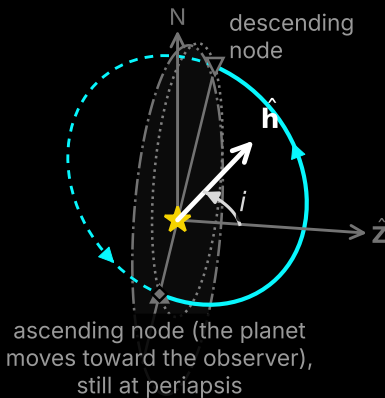

1. $R_Z(\Omega)$, $\Omega = 130^\circ$

turn about $+\hat{\mathbf{Z}}$, north toward east

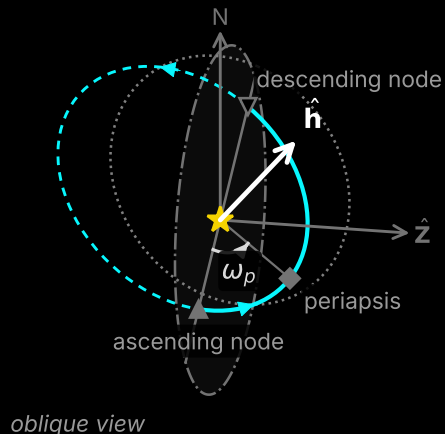

2. $R_X(i)$, $i = 55^\circ$

tilt about the node line

3. $R_Z(\omega_p)$, $\omega_p = 70^\circ$

turn about $\hat{\mathbf{h}}$, from the node

proposed observer profile (pending)
