

	Denominator	Numerator / denominator	Value
1	Host-star flux (textbook)	Φ_p/Φ_* : planet flux over host flux at one reference plane before the coronagraph; not in these images	1.0×10^{-10}
2	Unocculted PSF peak	planet peak pixel over the star's unmasked peak pixel at the planet's pixel phase: $3.7 \times 10^{-12} / 0.0390$; the off-axis peak is 94% of the unocculted peak	9.4×10^{-11}
3	Total incident stellar flux	planet peak pixel as a fraction of all the star's incident photons (the colorbar unit): $1 \times 10^{-10} \times 0.0368$	3.7×10^{-12} in the peak $0.25 \lambda/D$ pixel
4	An aperture sum (yield package)	planet sum in the aperture over the same sum for a source with planet flux equal to the star's (the core throughput): $5.8 \times 10^{-11} / 0.58$	1.0×10^{-10}

Rows 1 and 4 agree by construction; compare ratios only when their denominators match.
