

How do three rotations place the orbit?
 $\mathbf{r} = R_Z(\Omega) R_X(i) R_Z(\omega_p) [r \cos \nu, r \sin \nu, 0]^T$
one factor per panel, left to right; dotted: the orbit before the turn

proposed observer profile (pending)
orbit to scale

1. $R_Z(\Omega), \Omega = 130^\circ$
turn about $+\hat{\mathbf{Z}}$, north toward east

2. $R_X(i), i = 55^\circ$
tilt about the node line

3. $R_Z(\omega_p), \omega_p = 70^\circ$
turn about $\hat{\mathbf{h}}$, from the node
