

Fixed angular grid: the source stays put, the dark ring growsstores $u_{\text{ref}} = \alpha D / \lambda_{\text{ref}}$ with $\lambda_{\text{ref}} = 500$ nm; angular spacing $du_{\text{ref}} \lambda_{\text{ref}} / D$ at every λ **Native grid: the dark ring keeps its size, the source moves**stores $u_{\lambda} = \alpha D / \lambda$ with fixed native spacing du ; angular spacing $du \lambda / D$ grows with λ 

○ sky source at one fixed angle

--- first dark ring (analytic zero)

+ optical axis
